

Name:

Enrolment No:

**UNIVERSITY OF PETROLEUM AND ENERGY STUDIES**  
**End Semester Examination, December 2019**

**Course: Materials Engineering**

**Program: B. Tech Mechanical**

**Course Code: MEMA 2003**

**Instructions:** Internal choice in Q 6, 10 & 11. Do not over attempt.

**Semester: III**

**Time 03 hrs.**

**Max. Marks: 100**

**SECTION-A (20 marks)**

S. No.		Marks	CO
Q 1	Classify following materials into their class of materials (metal/alloy, polymer, ceramic, composite): a) Superalloy, b) Teflon, c) Bronze, d) Alumina, e) Duralumin, f) Reinforced concrete, g) Carbon fibre reinforced polymer, h) Titanium Oxide	4	CO1
Q 2	Discuss the effect of grain size on the strength of a polycrystalline material.	4	CO4
Q 3	Discuss the effect of temperature on diffusivity.	4	CO1
Q 4	Draw a schematic stress-strain curve for a ductile material and show how to calculate resilience and toughness graphically from this diagram.	4	CO2
Q 5	List the Hume-Rothery rules which govern solubility in substitutional solid solutions.	4	CO1

**SECTION-B (40 marks)**

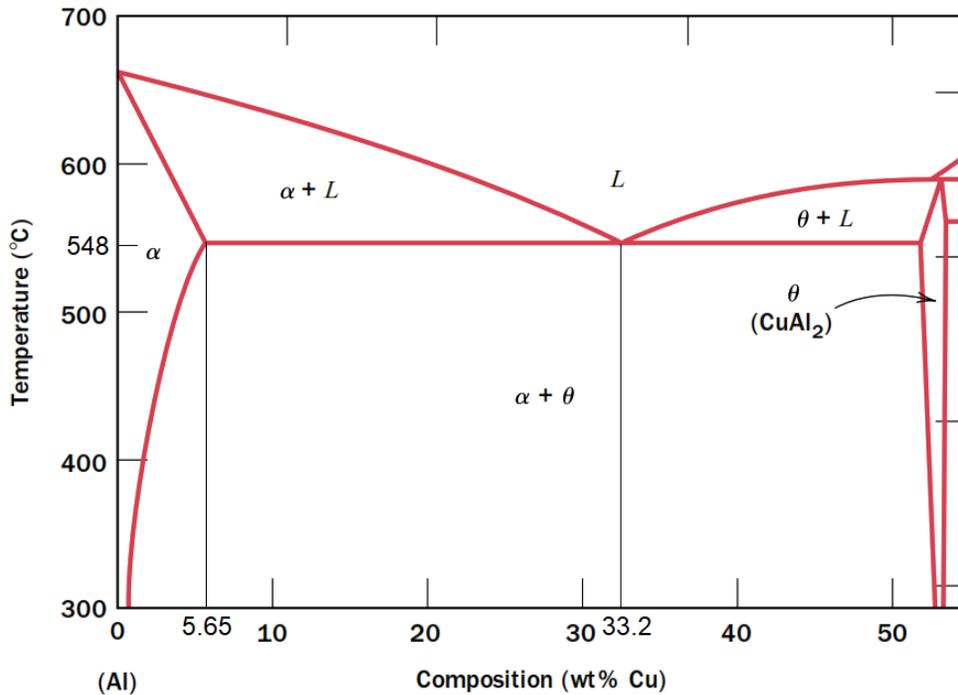

Q 6	<p>A hypothetical A–B alloy of composition 40 wt% B–60 wt% A at 300°C is found to consist of mass fractions of 0.66 and 0.34 for the <math>\alpha</math> and <math>\beta</math> phases, respectively. The composition of the <math>\alpha</math> phase is 13 wt% B–87 wt% A at 300°C.</p> <p>a) Plot the above information in a phase diagram. b) What is the composition of <math>\beta</math>-phase at 300°C?</p> <p style="text-align: center;"><b>OR</b></p> <p>For alloys of two hypothetical metals A and B, there exist an <math>\alpha</math>, A-rich phase and a <math>\beta</math>, B-rich phase. At 300°C, the fractions of <math>\alpha</math> &amp; <math>\beta</math> phases is given in below table for two different alloy compositions.</p> <table border="1" style="margin-left: auto; margin-right: auto;"><thead><tr><th><i>Alloy Composition</i></th><th><i>Fraction <math>\alpha</math> Phase</i></th><th><i>Fraction <math>\beta</math> Phase</i></th></tr></thead><tbody><tr><td>70 wt% A–30 wt% B</td><td>0.78</td><td>0.22</td></tr><tr><td>35 wt% A–65 wt% B</td><td>0.36</td><td>0.64</td></tr></tbody></table> <p>a) Plot above information in a schematic phase diagram.</p>	<i>Alloy Composition</i>	<i>Fraction <math>\alpha</math> Phase</i>	<i>Fraction <math>\beta</math> Phase</i>	70 wt% A–30 wt% B	0.78	0.22	35 wt% A–65 wt% B	0.36	0.64	5 5	CO3
<i>Alloy Composition</i>	<i>Fraction <math>\alpha</math> Phase</i>	<i>Fraction <math>\beta</math> Phase</i>										
70 wt% A–30 wt% B	0.78	0.22										
35 wt% A–65 wt% B	0.36	0.64										

	b) Determine the composition of the phase boundary (solubility limit) for both $\alpha$ and $\beta$ phases at 300°C.	5							
Q 7	<p>a) Define hardenability.  b) Discuss the Jominy-end quench test used for measuring hardenability.  c) The graph below depicts the Jominy-end quench test results for 5 different grades of steel – 1040, 4140, 4340, 5140 and 8640. Using the graph below, measure the hardenability of each steel.</p> <p>The graph plots Hardness HRC (left y-axis, 20 to 60) and Percent Martensite (right y-axis, 50, 80, 100) against Distance from quenched end (x-axis, 0 to 2 inches and 0 to 50 mm). Five curves represent different steel grades: 1040, 4140, 4340, 5140, and 8640. The 1040 steel shows the lowest hardenability, dropping to ~20 HRC at 0.75 inches. The 4340 steel shows the highest hardenability, maintaining ~50 HRC at 2 inches.</p>	2 4 4	CO2						
Q 8	<p>Consider one such alloy that initially has a uniform carbon concentration of 0.25 wt% and is to be treated at 950°C. If the concentration of carbon at the surface is suddenly brought to and maintained at 1.20 wt%, how long will it take to achieve a carbon content of 0.80 wt% at a position 0.5 mm below the surface? Use the equation and data given below:  The diffusion coefficient for carbon in iron at 950°C = <math>1.6 \times 10^{-11} \text{m}^2/\text{s}</math></p> $\frac{C_x - C_0}{C_s - C_0} = 1 - \text{erf}\left(\frac{x}{2\sqrt{Dt}}\right)$ <table border="1" data-bbox="868 1407 1144 1543"> <thead> <tr> <th><math>z</math></th> <th><math>\text{erf}(z)</math></th> </tr> </thead> <tbody> <tr> <td>0.35</td> <td>0.3794</td> </tr> <tr> <td>0.40</td> <td>0.4284</td> </tr> </tbody> </table>	$z$	$\text{erf}(z)$	0.35	0.3794	0.40	0.4284	10	CO4
$z$	$\text{erf}(z)$								
0.35	0.3794								
0.40	0.4284								
Q 9	<p>a) Define endurance limit of a material; and draw a schematic S-N curve for a material that exhibits an endurance limit.  b) Draw a typical creep curve of a material subject to constant stress at elevated temperatures.</p>	5 5	CO2						

**SECTION-C (40 marks)**

Q 10

Consider an Al-Cu alloy with phase diagram as shown in figure below:

- a) Based on above phase diagram, identify the composition range over which Al-Cu alloys can be precipitation hardened. Briefly describe the approach used for obtaining this range.

5

Consider an Al-4% Cu alloy and **answer any three of the following:**

- b) Show the solution heat treatment and precipitation heat treatment using a cooling curve (temperature vs time curve).
- c) Draw a schematic diagram showing strength of the precipitation hardened alloy as a function of ageing time.
- d) Briefly describe the microstructural evolution during precipitation hardening as the alloy changes from a supersaturated phase  $\rightarrow$  transition phase  $\rightarrow$  equilibrium phase.
- e) Calculate the maximum wt. % of  $\theta$  phase that can exist in the precipitation hardened alloy if the room temperature solubility of Cu in Al is 0.2 wt.% and room temperature composition of  $\theta$  phase is Al-53 wt.% Cu.

Q 11

a) Draw the Fe-C equilibrium phase diagram depicting eutectoid and eutectic phase transformation.

10

CO1

A eutectoid plain carbon steel is heated to 760°C and held at this temperature to achieve a complete and homogenous austenitic structure. Show **any two of the following** heat treatment processes on the T-T-T curve drawn above and specify the final microstructure (in terms of phases present):

b) Rapidly cool to 350°C, hold for 10<sup>4</sup> s, and quench to room temperature.

5

c) Rapidly cool to 250°C, hold for 100 s, and quench to room temperature.

5

d) Rapidly cool to 650°C, hold for 20 s, rapidly cool to 400°C, hold for 10<sup>3</sup> s, and quench to room temperature.
