**UPES**

**End Semester Examination, December 2023**

**Course: Applied Numerical Methods**

**Program: B.Tech AE/ME**

**Semester: III**

**Time: 03 hrs**

**Course Code: MATH2053**

**Max. Marks : 100**

Instructions: You must answer all of the questions. Use a scientific calculator as required for your calculations.

**SECTION A  
(5QX4M=20 Marks)**

S. No.		Marks	CO
Q 1	Is this system of equations well-conditioned? $\begin{bmatrix} 1 & 2 \\ 2 & 3 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 4 \\ 7 \end{bmatrix}$	4	CO3
Q 2	Determine the LU decomposition for the given matrix. $\begin{bmatrix} 4 & 3 \\ 3 & 4 \end{bmatrix}$ Employ Cholesky's method to decompose the coefficient matrix.	4	CO3
Q 3	Present the general structure of a first-order initial value problem. Outline the standard representation of Euler's method for solving initial value problems of the first order.	4	CO3
Q 4	Write the second order difference approximations for (i) $y'(x_i)$ and (ii) $y''(x_i)$ based on central differences.	4	CO4
Q 5	Write out the diagonal five-point formula for solving (i) Laplace's equation $u_{xx} + u_{yy} = 0$ and (ii) Poisson equation $u_{xx} + u_{yy} = G(x, y)$ with uniform mesh spacing $h$ .	4	CO4

**SECTION B  
(4QX10M=40 Marks)**

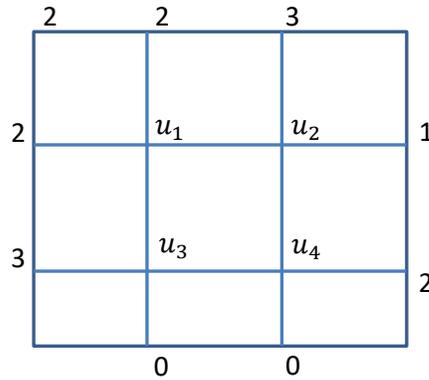

Q 6	Apply the LU decomposition method with the Doolittle technique for the decomposition of the coefficient matrix to solve the given system of simultaneous linear equations. $\begin{bmatrix} 2 & 3 & 1 \\ 1 & 2 & 3 \\ 3 & 1 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 9 \\ 6 \\ 8 \end{bmatrix}$	10	CO3
-----	---	----	-----

Q 7	<p>Apply Newton's forward interpolation to estimate the velocity at <math>x = 0.4 \text{ cm}</math> for a fluid near a flat surface, given the velocity distribution provided below where <math>x</math> represents the distance from the surface (<math>\text{cm}</math>) and <math>v</math> denotes the velocity (<math>\text{cm/s}</math>).</p> <table border="1" data-bbox="203 348 976 428"> <tr> <td>Distance (<math>x</math>)</td> <td>0.1</td> <td>0.3</td> <td>0.5</td> <td>0.7</td> <td>0.9</td> </tr> <tr> <td>Velocity (<math>v</math>)</td> <td>0.72</td> <td>1.81</td> <td>2.73</td> <td>3.47</td> <td>3.98</td> </tr> </table>	Distance ( $x$ )	0.1	0.3	0.5	0.7	0.9	Velocity ( $v$ )	0.72	1.81	2.73	3.47	3.98	10	CO2
Distance ( $x$ )	0.1	0.3	0.5	0.7	0.9										
Velocity ( $v$ )	0.72	1.81	2.73	3.47	3.98										
Q 8	<p>The following system of equations is designed to determine concentrations (the <math>c</math>'s in <math>\text{g/m}^3</math>) in a series of coupled reactors as a function of the amount of mass input to each reactor (the right-hand sides in <math>\text{g/day}</math>),</p> $15c_1 - 3c_2 - c_3 = 3300$ $-3c_1 + 18c_2 - 6c_3 = 1200$ $-4c_1 - c_2 + 12c_3 = 2400$ <p>Execute two iterations of the Gauss-Seidel method with an initial approximation set as <math>[c_1, c_2, c_3]^T = [0, 0, 0]</math>.</p>	10	CO3												
Q 9	<p>A ball at <math>1200 \text{ K}</math> is allowed to cool down in air at ambient temperature of <math>300 \text{ K}</math>. Assuming heat is lost only due to radiation, the differential equation for the temperature of the ball is given by</p> $\frac{d\theta}{dt} = -2.2067 \times 10^{-12}(\theta^4 - 81 \times 10^8), \quad \theta(0) = 1200 \text{ K}$ <p>where <math>\theta</math> is in <math>\text{K}</math> and <math>t</math> in seconds. Determine the temperature at <math>t = 240 \text{ s}</math> using the fourth order Runge-Kutta (RK) method, assuming a step size of <math>h = 240 \text{ s}</math>.</p> <p style="text-align: center;"><b>OR</b></p> <p>Solve the boundary value problem <math>(1 + x^2)y'' + 4xy' + 2y = 2, y(0) = 0, y(1) = 1/2</math> by finite difference method. Use central difference approximations with <math>h = 1/3</math>.</p>	10	CO3												
<b>SECTION C</b> <b>(2QX20M=40 Marks)</b>															
Q 10	<p>The ideal gas law is given by</p> $pv = RT$ <p>where <math>p</math> is the pressure, <math>v</math> is the specific volume, <math>R</math> is the universal gas constant, and <math>T</math> is the absolute temperature. This equation is only accurate for a limited range of pressure and temperature. Vander Waals came up with an equation that was accurate for larger range of pressure and temperature given by</p>	20	CO1												

$$\left(p + \frac{a}{v^2}\right) (v - b) = RT$$

where  $a$  and  $b$  are empirical constants dependent on a particular gas. Given the value of  $R = 0.08$ ,  $a = 3.592$ ,  $b = 0.04267$ ,  $p = 10$  and  $T = 300$  (assume all units are consistent), one is going to find the specific volume,  $v$ , for the above values. Without finding the solution from Vander Waals equation, what would be a good initial guess for  $v$ ? Utilize Newton-Raphson method and conduct two iterations. Show all steps in calculating the estimated root, absolute relative approximate error for each iteration.

Q 11 Solve the following Laplace equation  $u_{xx} + u_{yy} = 0$  numerically, using five-point formula and Liebmann iteration, for the following mesh with uniform spacing and with boundary conditions as shown below in the figure. Obtain the results correct to two decimal places.

**OR**

Solve by Crank-Nicolson method the following heat conduction equation

$$u_t = u_{xx}$$

subject to  $u(x, 0) = 0$ ,  $u(0, t) = 0$  and  $u(1, t) = t$ , for two time steps.
